

- Acid and base definitions
  - **Bronsted-lowry acid** is a proton (H<sup>+</sup>) donor
  - **Bronsted-lowry base** is a proton (H<sup>+</sup>) acceptor
  - **Lewis acid** is an electron acceptor
  - **Lewis base** is an electron donor
- Acid strength
  - MAJOR TIP: memorize pK<sub>a</sub> values as it will make ranking acids much easier. I put a terrific table on the very last page of this chapter: memorize the values.
  - General factors that determines acidity (most important to least important):
    - 1) Acidity of H-A increases left to right across a row and down the periodic table (**polar and polarizable**). The opposite trend applies to base strength.

	GROUP			
	4A	5A	6A	7A
Period 2	CH <sub>4</sub> No acid or base properties	NH <sub>3</sub> Weak base	H <sub>2</sub> O ---	HF Weak acid
Period 3	SiH <sub>4</sub> No acid or base properties	PH <sub>3</sub> Weak base	H <sub>2</sub> S Weak acid	HCl Strong acid

- 2) Acidity of H-A increases if the conjugate base can resonate
    - NOTE: if a ring, when deprotonated, becomes an aromatic ring, then acidity greatly increases.
  - 3) Acidity of H-A increases with the presence of electronegative atoms in A (**inductive stabilization**)
    - NOTE: distance matters! When an electronegative atom is closer to the proton, the effect is stronger and acidity increases.
  - 4) Acidity of H-A increases as the % s character of the conjugate base increases ( $sp > sp^2 > sp^3$ ).
    - NOTE: intramolecular H-bonding decreases acidity as the hydrogens are less likely to be deprotonated.
- Basicity of amines and aromatics
  - Alkyl amines are more basic than NH<sub>3</sub> because of electron donating R-groups.
  - Alkyl amines are more basic than aryl amines.
  - Electron donating groups (refer to EAS chapter) increase basicity/decrease acidity on aryl amines.
  - Electron withdrawing groups (refer to EAS chapter) decrease basicity/increase acidity on aryl amines.
  - In heterocyclic aromatic compounds, if the heteroatom's (nitrogen, oxygen, etc.) electrons do not contribute to aromaticity, then it is more basic.
  - Higher % s character ( $sp > sp^2 > sp^3$ ) of the orbital containing the lone pair, the less basic/more acidic the compound is.
- Determining K<sub>eq</sub>
  - $K_{eq} = 10^{pK_a \text{ conjugate acid} - pK_a \text{ acid}}$

Functional group	Example	pKa	Conjugate Base
Alkane	$\text{H}_3\text{C}-\text{CH}_2-\text{CH}_3$	~50	$\text{H}_3\text{C}-\text{CH}_2-\text{CH}_2^-$
Alkene	$\text{H}_2\text{C}=\text{CH}_2$	~43	$\text{H}_2\text{C}=\text{CH}^-$
Hydrogen	$\text{H}-\text{H}$	36	$\text{H}^-$
Amine	$\text{NH}_3$	~35	$\text{NH}_2^-$
Sulfoxide	$\text{H}_3\text{C}-\text{S}(=\text{O})-\text{CH}_3$	31	$\text{H}_3\text{C}-\text{S}(=\text{O})-\text{CH}_2^-$
Alkyne	$\text{R}-\text{C}\equiv\text{C}-\text{H}$	25	$\text{R}-\text{C}\equiv\text{C}^-$
Ester	$\text{H}_3\text{CO}-\text{C}(=\text{O})-\text{CH}_3$	25	$\text{H}_3\text{CO}-\text{C}(=\text{O})-\text{CH}_2^-$
Nitrile	$\text{H}_3\text{C}-\text{C}\equiv\text{N}$	25	$\text{H}_2\text{C}-\text{C}\equiv\text{N}^-$
Ketone/ aldehyde	$\text{H}_3\text{C}-\text{C}(=\text{O})-\text{CH}_3$	20-24	$\text{H}_3\text{C}-\text{C}(=\text{O})-\text{CH}_2^-$
Alcohol	$\text{H}_3\text{C}-\text{OH}$	17	$\text{H}_3\text{C}-\text{O}^-$
Water	$\text{HO}-\text{H}$	16	$\text{HO}^-$
Malonates	$\text{H}_3\text{CO}-\text{C}(=\text{O})-\text{CH}_2-\text{C}(=\text{O})-\text{OCH}_3$	13	$\text{H}_3\text{CO}-\text{C}(=\text{O})-\text{CH}^--\text{C}(=\text{O})-\text{OCH}_3$
Thiols	$\text{CH}_3\text{S}-\text{H}$	13	$\text{CH}_3\text{S}^-$
Protonated amines	$\text{NH}_4^+ \text{Cl}^-$	9-11	$\text{NH}_3$
Carboxylic acids	$\text{H}_3\text{C}-\text{C}(=\text{O})-\text{OH}$	4	$\text{H}_3\text{C}-\text{C}(=\text{O})-\text{O}^-$
Hydrofluoric acid	$\text{H}-\text{F}$	3.2	$\text{F}^-$
Sulfonic acids	$\text{Me}-\text{C}_6\text{H}_4-\text{SO}_3\text{H}$ (tosic acid)	-1	$\text{Me}-\text{C}_6\text{H}_4-\text{SO}_3^-$
Hydronium ion	$\text{H}_3\text{O}^+$	-1.7	$\text{H}_2\text{O}$
Sulfuric acid	$\text{H}_2\text{SO}_4$	-3	$\text{HSO}_4^-$
Hydrochloric acid	$\text{HCl}$	-6	$\text{Cl}^-$
Hydrobromic acid	$\text{HBr}$	-9	$\text{Br}^-$
Hydroiodic acid	$\text{HI}$	-10	$\text{I}^-$
