

1. acid/base	acid = donor base = acceptor	21. temperature conversion	$F \rightarrow C T - 32 / 1.8$ $C \rightarrow F T (1.8) + 32$
2. Alligation	higher % \ / parts of higher % desired % lower % / \ parts of lower % add parts to find total # of parts	22. water requirements in TPN	calculated first to avoid or correct volume depletion or overload
3. BMI	(weight kg)/(height m ²)	23. weak acid	$pH = pK_a + \log (\text{salt/acid})$
4. BSA in m²	sq root of [Ht(cm) x wt (kg)/3600]	24. weak base	$pH = pK_w - pK_b + \log (\text{base/salt})$ $pK_w = 14$
5. Ca carbonate to Ca citrate conversion	Ca carbonate is 40% Ca citrate is 21%		
6. Corrected calcium	$Ca(\text{corrected}) = Ca(\text{serum}) + [(4.0 - \text{albumin}) \times (0.8)]$ normal Ca = 8.5-10 mEq/L normal Albumin = 3.5-5 g/dL		
7. CrCl	$(140 - \text{age}) / (72 \times Cr) \times (\text{wt in kg})$ x 0.85 if female		
8. half life	$t(1/2) = 0.693 / k_e$ k_e = elimination constant		
9. IBW	males = 50kg + 2.3kg (inches over 5 ft) females = 45.5kg + 2.3kg (inches over 5 ft)		
10. kcal 10% fat emulsion	1.1 kcal/mL		
11. kcal 20% fat emulsion	2 kcal/mL		
12. kcal Dextrose	3.4 kcal/g		
13. kcal lipids	9 kcal/g		
14. kcal protein/amino acids	4 kcal/g		
15. milliequivalents	$mEq = mg \times \text{valence} / MW$		
16. Osmolarity	$mOsm/L = [(\text{conc g/L}) / MW] \times (\# \text{ of species}) \times 1000$		
17. signs of acidosis	pH < 7.5 inc. Cl dec. Bicarb if acidotic use at least 50% Na acetate, instead of NaCl		
18. signs of alkalosis	pH > 7.45 dec. Cl inc. Bicarb		
19. Specific Gravity	weight in g / volume in mL 1.1g of H ₂ O = 1 mL of water		
20. strength adjustments	$Q_1 C_1 = Q_2 C_2$ quantity and concentration
